Port Louis to Curepipe: Peak Traffic and Metro Express Data Report

Nikhil Gopaul · Data checked Nov 5, 2026

What this report can and cannot prove

I found no official vehicle count for this route for 2024, 2025 or 2026, so every peak-traffic figure here is ESTIMATED. The closest official number is a 2017 government-hosted forecast of 2020 peak-hour volumes, plus a reported figure of more than 55,000 vehicles a day at Pont Fer–Phoenix–Dowlut.

Your route needs one correction. It joins two different roads. The M1 runs via Pailles, Bagatelle, Réduit, St Jean and Phoenix. Beau Bassin, Rose Hill and Quatre Bornes are on the A1, and Vacoas is on neither.

Labels used for every number

- **OFFICIAL:** read directly in a government document.
- **OFFICIAL, REPORTED:** an official figure I could only read through a news article or other website.
- **FORECAST:** an official model output, not a count.
- **THIRD-PARTY:** from an unofficial website.
- **ESTIMATED:** my calculation, with the method shown.

NOT FOUND after searching

- A current official Metro timetable. The operator's site could not be opened from my tools, so please check it at mauritiusmetroexpress.mu (your checklist's mauritiusmetro.com did not appear in any source). Current times here come from a secondary guide.
- The World Bank document with corridor speeds. Only a World Bank congestion-cost figure, quoted by a journal paper, was found.
- Bus passenger numbers. The 2017 Statistics Mauritius digest has no passenger counts, only journeys and kilometres.
- Traffic counts published by NLTA, TMRSU, RDA or the Police.
- Commuters by town into Port Louis.
- The current Port Louis–Curepipe bus fare.

Summary table

About 15,000 to 20,000 vehicles are estimated on the road in each 2-hour peak in 2026, and the Metro beats a car only when road traffic is at its worst.

Item	Result	Year	Status
Heaviest route	M1 motorway, Port Louis to Curepipe	Evidence 2017–2023	ESTIMATED judgement: no official ranking found
Road distance	About 22 km	2026	THIRD-PARTY (Rome2Rio)
Metro distance	26 km	2026	OFFICIAL, REPORTED
Road time, peak, car	35 to 67 min, mid 49 min	2026	ESTIMATED
Road time, peak, bus	62 to 104 min, mid 78 min	2026	ESTIMATED
Metro time, end to end	About 52 min	2026	OFFICIAL, REPORTED
Vehicles 7–9am, both directions	14,933 to 20,058, mid 19,030	2026 estimate	ESTIMATED
Vehicles 4–6pm, both directions	15,312 to 20,316, mid 19,274	2026 estimate	ESTIMATED
Metro trips in each 2-hour window	12 to 15 per direction	2026	ESTIMATED from reported 8–10 min headway
Metro capacity in each 2-hour window	5,064 to 6,330 passengers per direction	2026	ESTIMATED from 422 per tram

The vehicle figures are one M1 section, not the whole road, and not every vehicle travels end to end.

Section 1: Heaviest route and bottlenecks

The M1 is the best-supported answer. The 2017 EIA calls it the road with better capacity, while the A1 has "serious congestions day and night". No source ranks the two roads by measured volume.

Route, in order (Port Louis to Curepipe)

1. Port Louis: Place d'Armes, Caudan, New Trunk Road
2. Cassis and Pailles
3. Sorèze (link towards Coromandel)
4. Bagatelle
5. Réduit
6. St Jean
7. Pont Fer, Jumbo and Dowlut (Phoenix)
8. Wooton
9. La Vigie
10. Curepipe

The first five names and the St Jean/Jumbo stops come from bus route stop lists, such as routes 141 and 163. The exact order is my reading of those lists and the articles below, not an official route document, so check it on a map.

Distance and time

Measure	Value	Year	Status and source
Driving distance	21.7 km	2026	THIRD-PARTY: Rome2Rio
Normal driving time	20 min	2026	THIRD-PARTY: Rome2Rio, likely free-flow and optimistic
Peak car time, fast case	35 min	2026	ESTIMATED: 3 km at 15 km/h + 19 km at 50 km/h
Peak car time, mid case	49 min	2026	ESTIMATED: 3.5 km at 12.5 km/h + 18.5 km at 35 km/h
Peak car time, slow case	67 min	2026	ESTIMATED: 4 km at 10 km/h + 18 km at 25 km/h

The 10–15 km/h Port Louis speeds come from a 2011 study and a journal paper, and they date from about 2004. The 25–50 km/h motorway speeds are my assumptions.

Alternative routes (distances NOT FOUND)

Route	Path	Use
A1	La Butte, Plaine Lauzun, Grande Rivière Nord Ouest, Coromandel, Beau Bassin, Rose Hill, Belle Rose, then Jumbo and Phoenix	Main alternative. Bus route 2 continues via St Paul, Castel and Eau Coulée
A1 via Vacoas	A1 to Quatre Bornes, then La Louise, Candos, Bonne Terre, La Caverne	Bus route 3 reaches Vacoas this way
M1 then Vacoas	M1 to Jumbo, then Palmerstone and Vacoas	Bus route 141
M3	Terre Rouge, Verdun, Trianon	Bypasses Port Louis for traffic from the north, so it does not help a trip starting in the city
M2	Port Louis north to Sottise	Runs the wrong way, so it is not a real alternative

Bottlenecks

Section	Why it is slow	Evidence	Status
Caudan and Place d'Armes	Peak traffic entering and leaving the city; a 2012 paper says 46% of corridor trips only pass by Port Louis	Le Mauricien, 2018 says this is worse than the M1 jam. 46% is from a search excerpt; the full paper was blocked	News report; no count
Bell Village and Old Moka Road	Named alongside Caudan; the jam moved here after flyovers further south	Le Mauricien, 2018 and 2023	News report; no count
Grande Rivière Nord Ouest	Traffic from Rose Hill, Beau Bassin and Coromandel struggles to reach the M1	Le Mauricien, 2018. The A1–M1 Link Road was planned to fix this	News report; no count
Coromandel, Beau Bassin, Rose Hill (A1)	Outdated road, no access control, many side roads	2017 EIA	OFFICIAL description

Section	Why it is slow	Evidence	Status
St Jean and Réduit	Earlier hot spots; flyovers moved the jam onward	Le Mauricien, 2023 (road safety expert Barlen Munisamy)	Expert opinion
Pont Fer, Jumbo, Dowlut (Phoenix)	Three junctions only 250–500 m apart, with over 55,000 vehicles a day; flyovers replaced the roundabouts	Le Mauricien, 2018 and 2023	OFFICIAL, REPORTED
Wooton	Roundabout where Curepipe traffic heading east converges; about 4,000 vehicles at peak hours	Le Mauricien, 2023. A flyover was under construction then; check its current status	OFFICIAL, REPORTED
Pailles roundabout, Vacoas, Curepipe town	NOT FOUND: no source I opened names these as measured bottlenecks	None	NOT FOUND

No source measures the effect of bus stops, schools or markets, so I have not claimed any.

Section 2: Peak traffic count estimate

The 2026 estimate is 7,500 to 11,100 vehicles towards Port Louis at 7–9am, and 9,000 to 12,200 towards Curepipe at 4–6pm. **All figures in this section are ESTIMATED: NOT FOUND - ESTIMATED FROM the 2017 EIA forecast of 2020 volumes, grown by 29% to match the increase in registered vehicles.** They are for one section of road, as average vehicles per hour across each 2-hour window. For the safest figures, use the LOW rows; MID and HIGH sit near road capacity and look high against the cross-check in the Methodology box.

Scenario, 2026	Direction	7–9am vehicles/hour	4–6pm vehicles/hour	Total 7–9am (2 hours)	Total 4–6pm (2 hours)
LOW	Curepipe to Port Louis	3,753	3,138	7,506	6,275
LOW	Port Louis to Curepipe	3,714	4,518	7,427	9,036
MID	Curepipe to Port Louis	5,261	3,827	10,523	7,655

Scenario, 2026	Direction	7–9am vehicles/hour	4–6pm vehicles/hour	Total 7–9am (2 hours)	Total 4–6pm (2 hours)
MID	Port Louis to Curepipe	4,253	5,810	8,507	11,619
HIGH	Curepipe to Port Louis	5,546	4,034	11,092	8,069
HIGH	Port Louis to Curepipe	4,483	6,124	8,967	12,248

Is the morning flow towards Port Louis? Yes, but less one-sided than 70/30. Le Mauricien reports the big morning jam on the M1 from the south towards Port Louis, and heavy afternoon congestion at Phoenix. The forecast volumes imply about 57/43 in the morning and 60/40 in the evening, not 70/30. That split depends on which direction I assigned to each forecast point (see Methodology), and through traffic may explain the strong counter-flow.

MID estimate by vehicle type, 2-hour totals

Vehicle type	Assumed share	Curepipe to Port Louis, 7–9am	Port Louis to Curepipe, 7–9am	Curepipe to Port Louis, 4–6pm	Port Louis to Curepipe, 4–6pm
Cars	70%	7,366	5,955	5,358	8,134
Motorcycles	15%	1,578	1,276	1,148	1,743
Vans	6%	631	510	459	697
Lorries	5%	526	425	383	581
Taxis	2%	210	170	153	232
Buses	2%	210	170	153	232

I found no classified count for this road, so these shares are my assumption. The registered fleet differs: in 2025, cars and dual-purpose vehicles were 56.8% and motorcycles 34.4%. That counts vehicles owned island-wide, not vehicles on the M1, and I assumed fewer motorcycles use the motorway.

Section 3: Where the Metro runs compared with the road

The Metro does not follow the M1. It runs a parallel corridor through the town centres, close to the A1 and the old railway, and meets the M1 mainly at Port Louis and around Phoenix.

Line 1 stations, Port Louis to Curepipe (20 stations, OFFICIAL, REPORTED by Mapa-Metro, checked August 2026)

Place d'Armes, Port Louis Victoria, St Louis, Coromandel, Barkly, Beau Bassin, Vandermeersch, Rose Hill Central, Belle Rose, Quatre Bornes Central, St Jean, Trianon, Phoenix, Phoenix Mall, Palmerston, Vacoas Central, Sadally, Floréal, Curepipe North, Curepipe Central.

Aapravasi Ghat appears on maps but is not open. Line 2 adds Ebene Cybercity and Mahatma Gandhi from Rose Hill.

Road and Metro compared

The distances are my rough estimates, about ±1 km, from general knowledge of the map. No source publishes them and I could not measure them with my tools, so measure each on Google Maps before you quote it.

Section	Road route town	Metro station nearby?	Nearest station	Road-to-station distance (ESTIMATED)
Port Louis	Caudan, Place d'Armes	Yes	Place d'Armes, Port Louis Victoria	Under 0.5 km
M1 north	Cassis, Pailles	Partly	St Louis	About 1.5 km
M1 north	Sorèze	Partly	Coromandel	1–2 km
M1 middle	Bagatelle	No on Line 1	Ebene Cybercity (Line 2)	About 1 km, with a change at Rose Hill
M1 middle	Réduit	No on Line 1	Mahatma Gandhi (Line 2)	About 1 km, with a change at Rose Hill
M1 middle	St Jean	Yes	St Jean	About 1 km
Phoenix	Pont Fer, Jumbo, Dowlut	Yes	Phoenix	Under 1 km; the Metro crosses at Jumbo at road level
M1 south	Wooton	No	Floréal or Curepipe North	2–3 km
M1 south	La Vigie	No	Curepipe Central	About 2 km

Section	Road route town	Metro station nearby?	Nearest station	Road-to-station distance (ESTIMATED)
A1 corridor	Coromandel, Beau Bassin, Rose Hill, Quatre Bornes	Yes	Same-name stations	Under 0.5 km

Where road users have no Metro option

- Wooton and La Vigie, including all traffic heading east towards Quartier Militaire and Flacq.
- Through traffic bypassing Port Louis towards the north, since Line 1 stops at Place d'Armes.
- Bagatelle and Réduit from Port Louis or Curepipe without a change at Rose Hill. A direct Curepipe–Mahatma Gandhi peak pilot was approved for 2026, and its outcome is not confirmed.
- Any trip after about 19:00, when service ends.

Time comparison, Port Louis to Curepipe in peak

Mode	Fast case	Mid case	Slow case	Metro time	Time saved by Metro	Status
Car	35 min	49 min	67 min	52 min	−17, −3 and +15 min	ESTIMATED
Bus	62 min	78 min	104 min	52 min	+10, +26 and +52 min	ESTIMATED: 26 km at 25, 20 and 15 km/h

The 52 minutes is station to station, so walking and waiting add to it. Rome2Rio lists 73 minutes for the Metro including transfers, against a planned 41–43 minutes before opening, so time it yourself if you can.

Section 4: Metro and road in the peak

The Metro may carry 19–23% of peak-direction people across the Metro and the M1, but its effect on road traffic is probably far smaller than that share. The mid estimate is about 1,100 fewer vehicles in 2 hours, or roughly 11% of the busiest flow.

Timetable and capacity

Item	Value	Year	Status and source
First service	06:00	2026	OFFICIAL, REPORTED: Mapa-Metro
End of service	19:00, may be the departure from the terminus	2026	OFFICIAL, REPORTED: Mapa-Metro
Peak frequency, Line 1	Every 8–10 min	2026	OFFICIAL, REPORTED: Mapa-Metro
Off-peak frequency	"Wider" than peak; current figure NOT FOUND	2026	NOT FOUND
Older official timetable	06:00–19:00; about 15 min peak and 30 min off-peak	2020	OFFICIAL, out of date: Metro Express communiqué
Capacity per tram	Up to 422 passengers (crush load, 6 people per m²)	2017 order	OFFICIAL, REPORTED: Mapa-Metro and Wikipedia citing CAF
Capacity per hour per direction	2,532 to 3,165 passengers	2026	ESTIMATED: 6 to 7.5 trams an hour × 422
Trips, 7–9am	12 to 15 each way	2026	ESTIMATED: 120 min ÷ 10 or 8 min
Trips, 4–6pm	12 to 15 each way	2026	ESTIMATED: same method
Capacity per 2-hour window per direction	5,064 to 6,330 passengers	2026	ESTIMATED: trips × 422

These assume one tram per trip and the same frequency in both windows. The 8–10 minute figure comes from a guide, not the operator's own timetable.

Metro ridership

Figure	Value	Year	Status and source
Annual passengers	12,111,804	FY 2024–25	OFFICIAL, REPORTED: Mapa-Metro
Average per day	33,183	FY 2024–25	ESTIMATED: 12,111,804 ÷ 365

Figure	Value	Year	Status and source
Daily passengers, Minister Mahomed	35,000–36,000	2026	OFFICIAL, REPORTED: Railways Africa excerpt; full article is paywalled
Daily passengers, older report	55,000	Jan 2023	Not used: much higher than the 2024–25 total allows

Metro passengers and road people, same windows (all ESTIMATED)

Scenario, 2026	Metro boardings, peak direction	Road vehicles, Curepipe to Port Louis, 7–9am	Road people, Curepipe to Port Louis, 7–9am	Metro share, 7–9am	Road vehicles, Port Louis to Curepipe, 4–6pm	Road people, Port Louis to Curepipe, 4–6pm	Metro share, 4–6pm
LOW	3,584	7,506	12,272	22.6%	9,036	14,775	19.5%
MID	5,778	10,523	22,234	20.6%	11,619	24,552	19.1%
HIGH	7,695	11,092	28,893	21.0%	12,248	31,905	19.4%

This comparison is rough. Metro boardings count anyone boarding anywhere on the line, while road people are counted at one point on the M1. Boardings can also exceed capacity, because seats are reused as people get off, so 7,695 is not automatically impossible.

Does the Metro reduce road traffic?

Scenario	Former car users among boardings	People per car	Vehicles removed, 2 hours	Vehicles removed per hour	Share of MID 2026 7–9am flow (10,523)
LOW	15%	1.4	384	192	3.6%
MID	25%	1.3	1,111	556	10.6%
HIGH	35%	1.2	2,244	1,122	21.3%

Why it cannot be exact

- I found no before-and-after count on the M1 or A1.
- I found no survey of what Metro passengers used before, so the 15–35% is my assumption. Many probably came from buses, which frees up little road space.
- The registered fleet keeps growing, by 36,356 vehicles (5.1%) in 2025, which can fill any space freed.

The 2017 EIA expected a shift to the Metro of 3–27% of car trips, 36–53% of motorcycle trips and 5–31% of bus trips, varying by zone (FORECAST). That forecast measures trips by mode, while my 10.6% is a share of all vehicles, so the two compare only loosely. None of these figures has been checked against real traffic.

What a commuter saves per one-way peak trip (end to end)

Switching from	Time saved	Cost saved	Status
Car, paying the adult MECard fare of Rs 52	−17 to +15 min, mid −3 min	Rs 33.5 to Rs 87.9, mid Rs 64.6	ESTIMATED
Car, paying the student MECard fare of Rs 30	−17 to +15 min, mid −3 min	Rs 55.5 to Rs 109.9, mid Rs 86.6	ESTIMATED
Bus	+10 to +52 min, mid +26 min	NOT FOUND: bus fare not found	Time ESTIMATED

Car cost is 22 km at an assumed 5, 7 or 8 litres per 100 km, at Rs 77.70 per litre (THIRD-PARTY: OpenVan, 31 October 2026, citing STC). It leaves out parking, maintenance and the trip to the station. Fares are OFFICIAL, REPORTED by Mapa-Metro, and single tickets cost Rs 55.

Section 5: Population and commuting

The four Plaines Wilhems towns held 340,666 people in the 2022 census, and I estimate 20,000 to 34,000 of them commute to Port Louis. Population is official; **commuter numbers are NOT FOUND - ESTIMATED FROM population × 40% employed × 15%, 20% or 25% working in Port Louis.** Both percentages are my assumptions.

Area	Population, 2022 census (OFFICIAL, REPORTED)	Commuters LOW	Commuters MID	Commuters HIGH
Curepipe	70,008	4,200	5,601	7,001
Vacoas/Phoenix	107,433	6,446	8,595	10,743
Quatre Bornes	71,076	4,265	5,686	7,108
Beau Bassin/Rose Hill	92,149	5,529	7,372	9,215
Four towns total	**340,666**	**20,440**	**27,253**	**34,067**

For comparison, Port Louis had 140,403 residents and Plaines Wilhems district 340,780. Figures are from City Population, citing Statistics Mauritius. The census treats Vacoas/Phoenix and Beau Bassin/Rose Hill as single towns, so I have not split them.

The census does record workplace: the World Bank catalogue lists a workplace-district variable for 2011, but the page shows no totals. A Statistics Mauritius census table would replace my estimate.

Methodology box

I started from official forecast volumes rather than AADT, because no AADT for the M1 could be found. I then checked the result using the reported 55,000 vehicles a day.

Method A: the estimate used in this report

1. **Base data.** Table 8-3 of the 2017 EIA gives modelled 2020 peak-hour volumes. These are vehicles per hour at four points: 5 (AM 3,232, PM 2,702), 6 (3,198, 3,891), 7 (4,721, 3,207) and 8 (3,564, 4,868).
2. **Assign direction.** I treated points 5 and 7 as towards Port Louis because they are heavier in the morning, and points 6 and 8 as towards Curepipe because they are heavier in the evening.
3. **Choose scenarios.** LOW uses points 5 and 6. MID and HIGH use points 7 and 8, and differ only in step 6.
4. **Grow to 2026.** The fleet grew from 531,797 (2017) to 746,961 (2025), or 4.34% a year. Six years at that rate (2020 to 2026) is ×1.290. This implies about 779,000 vehicles in 2026, or 785,000 at 2025's 5.1% growth. I found no published 2026 fleet figure.
5. **Capacity cap.** Volume ÷ volume-to-capacity ratio gives about 5,688 vehicles an hour towards Port Louis and 7,606 towards Curepipe at points 7 and 8. Only the 7–9am flow towards Port Louis reaches the cap: 4,721 × 1.290 would be about 6,090, so I used 5,688. Beyond capacity, extra demand becomes longer queues, not more vehicles past a point.
6. **Second peak hour.** I assumed the quieter hour of the window carries 80% (LOW), 85% (MID) or 95% (HIGH) of the peak hour. So 2-hour total = peak hour × (1 + that share).

Worked example, MID, Port Louis to Curepipe, 4–6pm: 4,868 × 1.290 = 6,281 vehicles in the peak hour, using the unrounded factor. Then 6,281 × 1.85 = 11,619 in 2 hours, and 11,619 ÷ 2 = 5,810 per hour.

Method B: the AADT check you asked for

The closest figure is more than 55,000 vehicles a day in the Pont Fer–Phoenix–Dowlut area (2023, OFFICIAL, REPORTED). A 2016–17 survey summary gives over 50,000 at Pont Fer and Jumbo. Growing 55,000 by three years at 4.34% (×1.136) gives about 62,473 a day in 2026. Peak-hour share, directional split and second-hour share below are assumptions.

Case	Daily vehicles, 2026	Peak-hour share	Two-way peak hour	Peak-direction split	Peak direction, vehicles/hour	Second-hour share	Peak direction, 2-hour total
LOW	62,473	10%	6,247	55%	3,436	80%	6,185
MID	62,473	11%	6,872	60%	4,123	85%	7,628
HIGH	62,473	12%	7,497	65%	4,873	95%	9,502

How the two methods compare. Method B gives 6,185 to 9,502 vehicles in the peak direction. That overlaps Method A's LOW figures (7,506 and 9,036) but stays below its MID and HIGH figures (10,523 to 12,248). As a share of 62,473 a day, Method A's two-way peak hour is 13.3–13.6% for LOW and 16.5–16.7% for MID, against an assumed normal 10–12%. **Use LOW or Method B as your main figure, and treat MID and HIGH as the upper limit.**

People per vehicle (assumed)

Scenario	Cars	Taxis	Motorcycles	Vans	Lorries	Buses	Average, using the assumed mix
LOW	1.2	1.2	1.0	1.1	1.1	25	1.64
MID	1.4	1.5	1.1	1.3	1.2	40	2.11
HIGH	1.6	2.0	1.2	1.5	1.5	55	2.60

Metro boardings. Daily passengers × Line 1 share × share in the 2-hour window × peak-direction share. LOW is 33,182 × 90% × 20% × 60%, MID is 35,500 × 93% × 25% × 70%, and HIGH is 36,000 × 95% × 30% × 75%. All the percentages are my assumptions, and I applied the same figures to both windows.

What is uncertain, biggest first

1. **Locations of points 5–8.** They are shown only in EIA Figure 8-4, which I could not see in the text I read. They lie near the A1–M1 Link Road at the Port Louis end, and some may be on the A1. Check page 8-8 of the PDF before you present.
2. **Direction.** I inferred it from the AM/PM pattern, so the 57/43 split is not independent proof of the flow.
3. **Age of the data.** It is a 2017 forecast. It came before the Metro and Phoenix flyovers opened, and fleet growth may not equal traffic growth. The model already allowed for a shift to the Metro, so do not subtract the vehicles-removed figures from these volumes.

4. **One section of road.** Volumes vary by section, and 55,000 may double-count vehicles crossing more than one junction.
5. **Vehicle mix, occupancy and Metro shares.** All are assumptions.

The best fix is your own count: stand at one M1 overbridge for 15 minutes per direction in each window and multiply by 8. That gives you a real 2026 number to set against these estimates.

Data register

These are the supporting official and reported numbers not already labelled in the tables above.

Number	What it is	Year	Source	Status
746,961	Registered vehicles, total (710,605 a year earlier)	End 2025	L'Express via allAfrica, citing Statistics Mauritius	OFFICIAL, REPORTED
423,869	Cars, double cabs and dual-purpose vehicles	End 2025	Same	OFFICIAL, REPORTED
257,269	Motorcycles and autocycles	End 2025	Same	OFFICIAL, REPORTED
3,418	Buses	End 2025	Same	OFFICIAL, REPORTED
692,798	Registered vehicles: 383,895 cars, 245,986 motorcycles, 31,351 vans, 19,181 lorries, 3,259 buses, 9,126 other	June 2024	Statistics Mauritius indicator, excerpt, copy on a third-party site; total is my sum	OFFICIAL, REPORTED
531,797	Registered vehicles, including 6,909 taxis	End 2017	Statistics Mauritius digest, Table 1.2	OFFICIAL
4,829 thousand	Bus vehicle-journeys, 2017 (provisional); 8.0 journeys per bus per day	2017	Same, Table 1.8	OFFICIAL

Number	What it is	Year	Source	Status
2,686 km	Road network, including 100 km of motorway	2017	Same, Table 1.1	OFFICIAL
24 buses/hour	Busiest bus route at Pont Fer–Jumbo, peak; 22 routes in the area	2016–17	EIA chapter summary on Scribd; summary only	OFFICIAL, REPORTED
